member and the enclosing member is in the open position.

30 52. An insertion device as claimed in Claim 48, wherein the enclosing member comprises at least two hinge portions for opening and closing the enclosing member, wherein the enclosing member has grooves, wherein the peripheral edge of the deformable intraocular lens engages the grooves and the grooves support the deformable intraocular lens when the deformable intraocular lens is in the enclosing member and the enclosing member is in the open position, whereby the optical portion of the deformable intraocular lens substantially does not come into contact with the hinge portions when the enclosing member is in the open position.

31 53. An insertion device as claimed in Claim 48, wherein the enclosing member comprises hinge portions at two circumferential positions for opening and closing the enclosing member, wherein the enclosing member has grooves, wherein the peripheral edge of the deformable intraocular lens engages the grooves and the grooves support the deformable intraocular lens when the deformable intraocular lens is in the enclosing member and the enclosing member is in the open position, whereby the optical portion of the deformable intraocular lens substantially does not come into contact with the hinge portions when the enclosing member is in the open position.--.

IN THE SPECIFICATION

Please replace the first paragraph on page 5 of the specification (see lines 1-12 on page 5) with the amended paragraph set forth below.

D⁶ reinforcing the positions where the base 3a of the supports 3 are embedded. The deformable intraocular lens 1 shown FIG. 33 is configured in the same manner as is the deformable intraocular lens of FIG. 32 except that the projections 2a are omitted. Each of the deformable intraocular lenses shown in FIGS. 34 and 35 is composed of a circular optical portion 2 and a pair of thin plate-shaped support portions 4 that are integral with the optical portion 2. The optical portion 2, like the optical portion 2 shown in FIG. 32, is made of an elastic material having predetermined memory characteristics. The support portions 4 are projected from the periphery of the optical portions 2 in opposite directions.

Please replace the last paragraph on page 14 of the specification (see lines 13-26 on page 14) with the amended paragraph set forth below.

D⁷ FIGS. 1 to 7 show an insertion device according to a first embodiment of the present invention. In FIGS. 1 to 7, numeral 10 denotes a body of the insertion device; numeral 1 denotes a deformable intraocular lens for cataract treatment; numeral 5 denotes an enclosing member built into the body 10; numerals 6a and 6b each denote a hinge portion provided on the enclosing member 5; numeral 7 denotes a lens receiving section which is formed upon opening of the enclosing member 5 in order to receive the intraocular lens 1; numeral 8 denotes a holder which is provided on the body 10 and is adapted to close the enclosing member 5 and maintain the closed state; numeral 9 denotes an annular retainer member for

D7 maintaining the enclosing member 5 in an opened state when the deformable intraocular lens 1 is to be

Please replace the first paragraph on page 22 of the specification (see lines 1-7 on page 22) with the amended paragraph set forth below.

D8 intraocular lens 1 is made of an elastic material having predetermined memory characteristics. The support portions 4 are projected from the periphery of the optical portion 2 in opposite directions (vertically opposite directions in FIG. 35), and the peripheral edge portions 4a are slightly projected from the optical portion 2 rightward and leftward in FIG. 35.

Please replace the last paragraph on page 25 of the specification (see lines 16-27 on page 25) with the amended paragraph set forth below.

D9 In the insertion device according to the sixth embodiment having the above-described structure, when the quadrant-shaped upper portions of the enclosing member 5 are opened, the lens receiving section 7 is formed on the enclosing member 5. Subsequently, the deformable intraocular lens 1 is placed in the lens receiving section 7. In order to obtain sufficient lubrication effect, a lubricant or the like is preferably applied to the lens receiving section 7. Subsequently, the enclosing member 5 into which the deformable intraocular lens 1 is placed is fitted into the
